FRANCESCO ANTICI

SAT CONSTRAINTS EMBEDDINGS

CARDINALITY CONSTRAINTS

- In most of the exercises we solved we found a cardinality constraint.
- Cardinality constraints are the ones in the form:

$$p_1 + \ldots + p_n \mathrel{\substack{\leq \\ = \\ \geq}} k$$

CARDINALITY CONSTRAINTS

- In sat these constraints are represented by:
  - at_least_one, at_most_one and $exactly\_one$;
  - at_least_k, at_most_k and $exactly\_k$.
- The encodings we presented can be very inefficient with big instances, so we need to find better ones.

CARDINALITY CONSTRAINTS

- Keeping in mind that:

$$at\_least\_k(V, k) \equiv at\_most\_k(\{\neg v \mid v \in V\}, |V| - k)$$

$$exactly\_k(V) \equiv at\_most\_k(V) \wedge at\_least\_k(V)$$

- We are going to focus just on the at_most_k constraint.

AT MOST ONE-PAIRWISE ENCODING

- The pairwise(or naive) encoding of the at_most_one constraint is:

$$\bigwedge_{1 \leq i < |V|} \bigwedge_{i+1 \leq j \leq |V|} \neg(V_i \wedge V_j)$$

- This encoding doesn't require the addition of any new variables, but it encodes $O(n^2)$ clauses, with $n = |V|$.

AT MOST ONE-SEQUENTIAL ENCODING

- The sequential encoding of the $at\_most\_one(V)$ constraint consist of using $n-1$ variables s_i to keep track of which V_i is true, it is encoded as follows:

$$(\neg V_1 \vee s_1) \wedge (\neg V_n \vee \neg s_{n-1}) \wedge \bigwedge_{1<i<n} ((\neg V_i \vee s_i) \wedge (\neg s_{i-1} \vee s_i) \wedge (\neg V_i \vee \neg s_{i-1}))$$

- This encoding produces $3n-4 (O(n))$ clauses, with $n = |V|$.

AT MOST ONE-BITWISE ENCODING

- The bitwise encoding of the $at\_most\_one(V)$ constraint consists of using $log_2(n)$ new variables $r_1, \ldots, r_{log_2(n)}$ to represent the binary encoding of the index of the variable which is true, so it is encoded like:

$$\bigwedge_{1<i<n} \bigwedge_{1<j<log_2(n)} \neg V_i \vee r_{i,j}$$

- This encoding produces $nlog_2(n)$ clauses, with $n = |V|$.

AT MOST ONE-HEULE ENCODING

- The Heule encoding is another linear version of the $at\_most\_one(V)$ constraint applicable for n > 4, which consists of splitting the pairwise encoding in two parts, adding an auxiliary variable y:

$$at\_most\_one(V_1, .., V_3, y) \wedge at\_most\_one(\neg y, V_4, .., V_n)$$

- This encoding require the addition of 1 new variable, but it encodes $O(n)$ clauses, with $n = |V|$.

AT MOST K-PAIRWISE ENCODING

- The pairwise(or naive) encoding of the at_most_k constraint is:

$$at\_most\_k(V, k) \equiv \bigwedge_{X \subseteq V} \bigvee_{v \in X} \neg v$$

- This encoding doesn't require the addition of any new variables, but it encodes $\binom{n}{k+1}$ clauses of length $k+1$, with $n = |V|$.
- In the worst case, it can amount to a $O(2^n/\sqrt{n/2})$

AT MOST K-SEQUENTIAL ENCODING

- The sequential encoding of the $at\_most\_k(V, k)$ constraint consist of using $(n-1)*k$ variables s_i to keep track of which V_i is true, it is encoded as follows:

$$
\begin{array}{l}
(\neg x_1 \vee s_{1,1}) \\
(\neg s_{1,j}) \qquad \text{for } 1 < j \leq k \\
\left.\begin{array}{l}
(\neg x_i \vee s_{i,1}) \\
(\neg s_{i-1,1} \vee s_{i,1}) \\
\left.\begin{array}{l}
(\neg x_i \vee \neg s_{i-1,j-1} \vee s_{i,j}) \\
(\neg s_{i-1,j} \vee s_{i,j})
\end{array}\right\} \quad \text{for } 1 < j \leq k \\
(\neg x_i \vee \neg s_{i-1,k})
\end{array}\right\} \text{for } 1 < i < n \\
(\neg x_n \vee \neg s_{n-1,k})
\end{array}
$$

- This encoding needs $2nk + n - 3k - 1$ clauses, with $n = |V|$.
